

Automated Presence

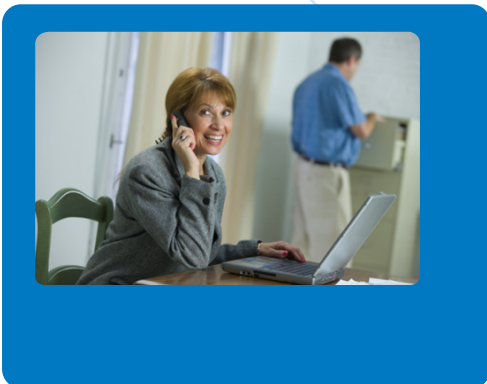

Stay Connected... Automatically

With Movius' suite of Automated Presence, communication is optimized to meet a subscriber's current location and activity.

Automated Find Me

Stepping away from your home phone... your calls are automatically sent to your mobile device.

Using Automated Presence you can be confident your calls will always get to you. You only have one phone number and one mailbox but your calls go where you need them. When driving, calls will be directed to your mobile phone; when in the office, calls will go to your office landline; and when working at home, calls will be directed to your home office phone. These scenarios can be automatically managed once defined by the subscriber without user actions and management. With Automated Presence all calls are automatically directed to the user's location and to the appropriate device.

Continuous Call

Walking back into your office... your call gets transferred from your mobile phone back to your office phone.

Today's users are always on the move, often attending calls while being mobile and then switching to a landline upon arrival at the office, home or sometimes a hotel. Mobile users often find themselves tethered to their mobile phone even after they arrive at the office or at home. Using Automated Presence, Movius Continuous Call delivers calls to the most convenient device for the subscriber. A call can be automatically and seamlessly handed off from a landline to a mobile phone and vice versa. This allows graceful uninterrupted call hand-off, and the caller on the other end never knows that you made the switch. It's that simple!

Hands Free Email

Catching up with your emails while driving... your most urgent emails are converted to audio.

Mobile email users often are completely disconnected while away from their office. If they are driving it is dangerous and often illegal for them to check their email. With Hands Free Email the users can establish a profile that allows only urgent emails to be read, all messages to be read or no messages to be read while they are mobile. The system will automatically change the delivery mechanism from email delivery to an audio outdial when the system detects the user is mobile. Voice activated controls will allow the user to remain hands free for replaying, deleting and saving of messages.
